Our Web Based Business Applications Solution

Our Services

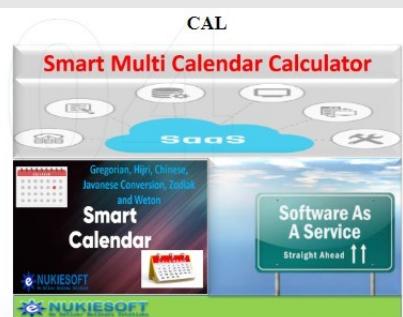

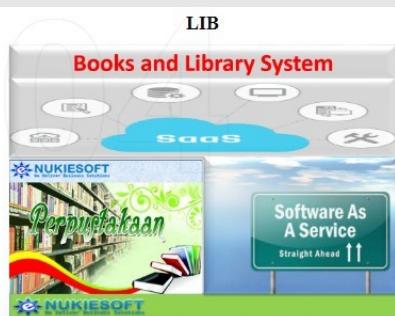

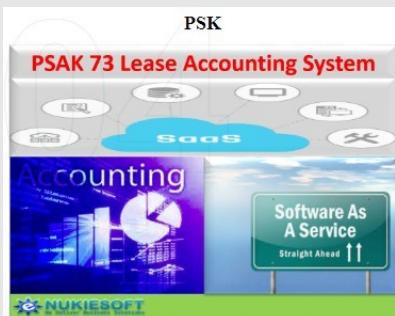

We Offer Web Based Software As Services (SaaS) For Your Business Solution

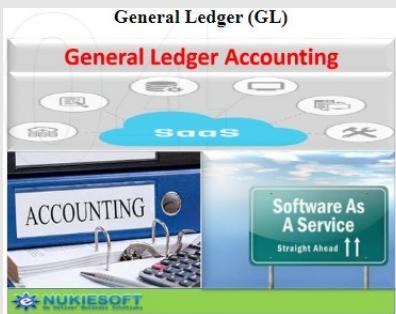

Nukiesoft, the software engineering services, believes, practices of the software engineering principles and best practices. Our adopted process framework, and our conviction on quality based our own software development experience, enables us to deliver the best to our customers.

While software engineering has been around for decades, its adoption leading to business success through improved quality and predictability has been, by and large, a mirage. Software is essentially a construction in mind and, a collective one at that, with many stakeholders of varying interests and skills. Applying the engineering principles is more of continuous refinements of an adaptive process rather than adoption of a prescriptive process.

Nukiesoft, with its wealth of acquired knowledge and more than a decade of experience, has specialized in transitioning itself and its customers into sound software engineering practices without undue documentation and technology overheads. We are the only IT Consultancy Management, Design and Development, Software as Services (SaaS) and Cloud Application Solutions.

[Read More →](#)**About Us**

Professional Business Application Service Provider.

Software as Service (SaaS) Provider

Software as a service (SaaS) is a software distribution model in which a third-party provider hosts applications and makes them available to customers over the Internet. SaaS is one of three main categories of cloud computing, alongside infrastructure as a service (IaaS) and platform as a service (PaaS).

VPS and Dedicated Application Services

We also offer Customers to run our Web Based Applications with a VPS that runs its own copy of an operating system, and customers may have superuser-level access to that operating system instance, so they can install multiple applications that runs on that OS.

The system working 24 hours with high bandwidth internet connection.

Agile Software Development

Agile software development is a conceptual framework for software engineering that promotes development iterations throughout the life-cycle of the project

Web Site Development

Our expert team of Website Developers & Digital Strategists use cutting edge technology & best practices to create custom sites that increase user engagement.

We understand that Every custom web development project is unique. We want to get to know your brand, understand your needs, and determine an appropriate timeline and project plan tailored to your business

VPS Server Based Services

The web based application will be installed in VPS (Virtual Private Server) in a hosting service provider that will use virtualization technology to provide you with dedicated (private) resources on a server with multiple users, so the user can access the application from anywhere using internet and browser.

VPS (Virtual Private Server) is a hosting service that uses virtualization technology to provide you with dedicated (private) resources on a server with multiple users.

VPS is a more secure and stable solution than shared hosting where you don't get a dedicated server space. However, it's smaller-scale and cheaper than renting an entire server.

VPS hosting is usually chosen by website owners who have medium-level traffic that exceeds the limits of shared hosting plans but still don't need the resources of a dedicated server.

Virtual private server solutions usually offer more than one hosting plan. For instance, at Hostinger, we have six VPS plans to suit different business needs and let you scale your site seamlessly when you need more resources.

In House Client Server Based Services

What is an In-House Server? As the name suggests, an in-house server is a server that is stored and maintained in your physical office space. Therefore, there is no need for an internet connection to access your data. You have physical control over your backup at all times.

Pros and Cons of In-House Servers

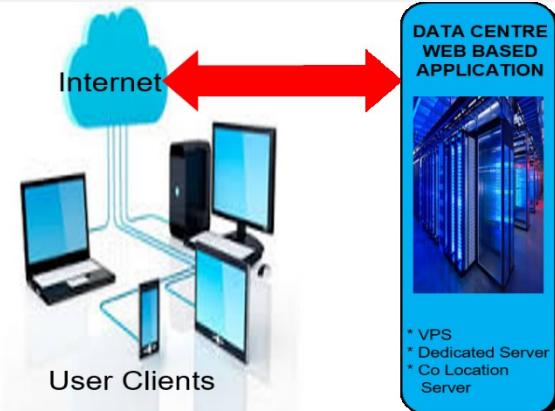

An in-house server can be beneficial for many reasons. First, it keeps all critical and sensitive information at your fingertips and away from third parties. This option can also be more cost-effective for small to mid-sized businesses. In-house servers have a few downsides as well. For instance, they require a substantial investment in infrastructure and hardware. Additionally, you will need physical space to store your server, such as a closet or rack. In-house servers can potentially be more vulnerable in disaster situations. In order to protect your data, it must be moved offsite routinely.

Dedicated/Colocated Server Based Services

Dedicated server is the ultimate hosting solution if you want to have flexibility and full control of the server equip with high Indonesia local bandwidth and best-performance server. You have the ability to customise the hardware needed to run your application, database or web server with High Performance Computing server, cost-effective and better security. Our dedicated server is always connected and located in the best data center facilities in IDC 3D Duren Tiga, Cyber 1 Building, NEX Data Center Tier 3, Jakarta Indonesia with 10 Gbps of local bandwidth and 1 Gbps of international bandwidth. You can easily choose a pre-configured base model dedicated server and customise with an option of linux or windows server operating system. We provide scalability options for best and cheap dedicated server services to help meet your business needs. Within 1×24 hour of payment confirmation and approval, your customized dedicated server will be ready to use.

INVENTORY MANAGEMENT

shutterstock

The diagram illustrates the architecture of the Logistics and Inventory System (ICS). It shows a central blue cloud icon labeled "Internet" connected by a double-headed red arrow to a vertical rectangular box on the right labeled "DATA CENTRE WEB BASED APPLICATION". Inside this box, there is an image of a server room. Below the main box, a list of services is provided:

- VPS
- Dedicated Server
- Co Location Server

Below the central box, the text "User Clients" is written, with three icons representing different devices (laptop, smartphone, tablet) connected to the central network.

APPLICATIONS CUSTOMIZATION AND DEVELOPMENT

We're Ready For Providing Web Based Applications Solution

We Are Developing The Whole Application, Using Agile Methodology.

The Agile methodology is a way to manage a project by breaking it up into several phases. It involves constant collaboration with stakeholders and continuous improvement at every stage. Once the work begins, teams cycle through a process of planning, executing, and evaluating. Continuous collaboration is vital, both with team members and project stakeholders.

Agile methodologies overview

The Agile Manifesto of Software Development put forth a groundbreaking mindset on delivering value and collaborating with customers when it was created in 2001. Agile's four main values are:

- * Individuals and interactions over processes and tools
- * Working software over comprehensive documentation
- * Customer collaboration over contract negotiation
- * Responding to change over following a

Agile project management

So what is Agile methodology in project management? It's a process for managing a project that involves constant collaboration and working in iterations. Agile project management works off the basis that a project can be continuously improved upon throughout its life cycle, with changes being made quickly and responsively.

Agile is one of the most popular approaches to project management due to its flexibility, adaptability to change, and high level of customer input.

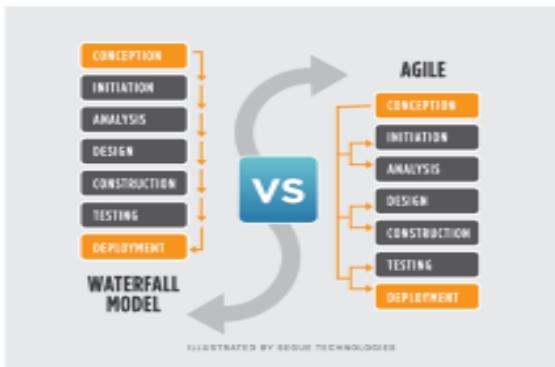

Agile methodologies frameworks

Agile project management is not a singular framework — rather, it can be used as an umbrella term to include many different frameworks. Agile project management can refer to terms including Scrum, Kanban, Extreme Programming (XP), and Adaptive Project Framework (APF).

AGILE SOFTWARE DEVELOPMENT METHODOLOGY

1. Requirement gathering
This is the first phase for every project when our business consultants meets the client to understand the course, design, and platform requirements.
2. Analysis and Design
Specialist from project management, software engineering, instructional design and graphics design analyzes the client's requirements, design hardware and software architecture and their implication on product development.
3. Development and Testing
We builds the application in progressive phase or increments upon approval of development specification by client. First prototype is created, which is functionally complete and runs on the actual platform envisaged or different prototyping techniques are used. Once the client approve the design and the prototype, the production team starts the development process. This is where scripting, creation of graphics, and coding take place. Testing begin right at the prototype phase and continue through various project milestones.
4. Deployment and Training
Once the system goes into production mode, comprehensive training is extended to the end users; not only to administer and maintain it, but also to make them understand the underlying technology and development tools. The end user are trained to use the application effectively. Follow up action in terms of close monitoring of the system and applications ensures immediate response to issue development.

AGILE SOFTWARE DEVELOPMENT METHODOLOGY

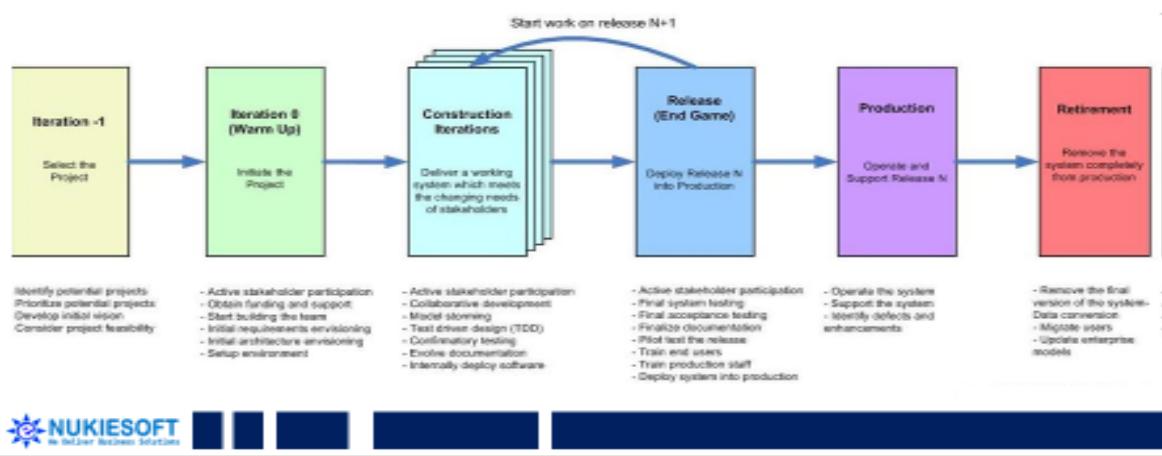

- Agile is a set of **practices, values, and principles** for software product development.

- In software product development, we think about "methodologies," "activities," "interactions," "results, work products or artifacts;" we think about "processes" that we use to organize the work:

- documents
- meetings and reviews
- diagrams and models
- coding and user documentation standards

- So will Agile Development define a new set of process activities? Not necessarily.

AGILE SOFTWARE DEVELOPMENT METHODOLOGY

AGILE SOFTWARE DEVELOPMENT METHODOLOGY

1. Our highest priority is to satisfy the customer through early and continuous delivery of valuable software.	5. Build projects around motivated individuals. Give them the environment and support they need, and trust them to get the job done.	9. Continuous attention to technical excellence and good design enhances agility.
2. Welcome changing requirements, even late in development. Agile processes harness change for the customer's competitive advantage.	6. The most efficient and effective method of conveying information to and within a development team is face-to-face conversation.	10. Simplicity--the art of maximizing the amount of work not done--is essential.
3. Deliver working software frequently, from a couple of weeks to a couple of months, with a preference to the shorter timescale.	7. Working software is the primary measure of progress.	11. The best architectures, requirements, and designs emerge from self-organizing teams.
4. Business people and developers must work together daily throughout the project.	8. Agile processes promote sustainable development. The sponsors, developers, and users should be able to maintain a constant pace indefinitely.	12. At regular intervals, the team reflects on how to become more effective, then tunes and adjusts its behavior accordingly.
